CONSENT FOR ICSI

Based on the review of your most recent semen analysis, and information which may have been available at the time of your IVF consult, the RMIA physician has recommended the performance of Intracytoplasmic Sperm Injection (ICSI) during your next IVF cycle.

ICSI is an IVF procedure in which a single sperm is injected directly into each egg. ICSI is used for patients with poor sperm quality, a reduced sperm count, or low fertilization rates (based on previous IVF cycles).

Our signatures below acknowledge that we have read the above, received answers to all of our questions, and indicate that we accept/decline the recommended procedure(s).

- We have decided to accept using ICSI in our IVF cycle
- We have decided to decline using ICSI in our IVF cycle
